

## ASSIGNMENT-7.3

(Error Debugging with AI: Systematic approaches to finding and fixing bugs)

HTNO:2303A51835

BATCH NO:27

### Task 1: Fixing Syntax Errors

#### Scenario

You are reviewing a Python program where a basic function definition contains a syntax error.

#### Requirements

- Provide a Python function `add(a, b)` with a missing colon
- Use an AI tool to detect the syntax error
- Allow AI to correct the function definition
- Observe how AI explains the syntax issue

#### Expected Output

- Corrected function with proper syntax
- Syntax error resolved successfully
- AI-generated explanation of the fix

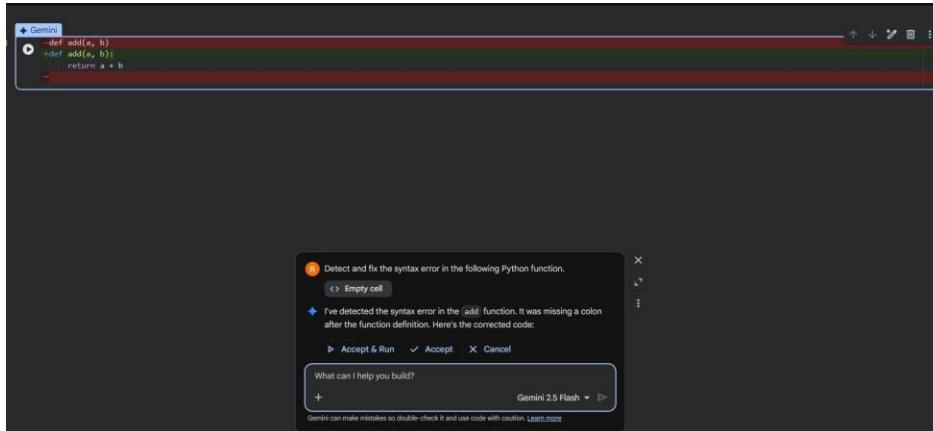

#### Prompt:

“Detect and fix the syntax error in the following Python function”

#### Buggy Code

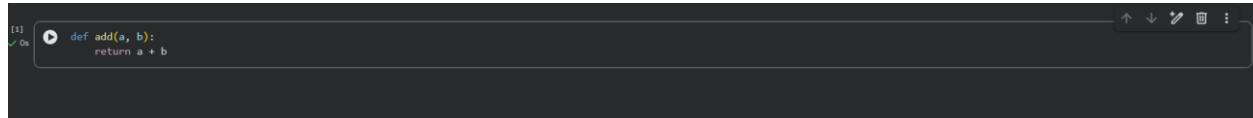

```
def add(a, b)
    return a + b
```

#### AI-Detected Issue

- Missing colon (:) at the end of the function definition.

#### Corrected code:

```
[1] 0s def add(a, b):
    return a + b
```

#### Explanation

- In Python, a colon is mandatory after function definitions.
- Without the colon, Python raises a SyntaxError.
- Adding the colon fixes the syntax issue and allows the function to execute properly.

## Task 2: Debugging Logic Errors in Loops

#### Scenario

You are debugging a loop that runs infinitely due to a logical mistake.

#### Requirements

- Provide a loop with an increment or decrement error
- Use AI to identify the cause of infinite iteration
- Let AI fix the loop logic
- Analyze the corrected loop behavior

#### Expected Output

- Infinite loop issue resolved
- Correct increment/decrement logic applied
- AI explanation of the logic error

#### Prompt:

“Identify and fix the logical error causing an infinite loop.”

#### Buggy Code

```
def count_down(n):
    while n >= 0:
        print(n)
        n += 1 # Should be n -= 1
```

#### AI-Detected Issue

A screenshot of a code editor window titled '[3]'. The code in the editor is:`def count_down(n):
 while n >= 0:
 print(n)
 n += 1 # Should be n -= 1

... File "/tmp/ipython-input-4228571664.py", line 4
 n += 1 # Should be n -= 1
 ^
IndentationError: unexpected indent`The code contains an indentation error on line 4 where 'n += 1' is indented. A tooltip at the bottom says 'Next steps: Explain error'.

- **IndentationError: unexpected indent**
- The loop control variable `n` is **incremented instead of decremented**.
- Since the condition is `n >= 0`, increasing `n` makes the condition always true.
- This results in an **infinite loop**.

### Corrected Code:

A screenshot of a code editor window titled '[3]'. The code in the editor is:`def count_down(n):
 while n >= 0:
 print(n)
 n -= 1`A tooltip box is open over the code, explaining the error:

The error `IndentationError: unexpected indent` means that a line of code was improperly indented, which is syntactically incorrect in Python. Specifically, it seems the line `n += 1` was indented too much. The error message also correctly suggested that for a countdown, `n` should be decremented, not incremented. However, inspecting the current code in the

Buttons in the tooltip box include 'Show an example of using the add function', 'Add docstrings to the add function', 'How can I help you build?', '+', 'Gemini 2.5 Flash', and 'Gemini can make mistakes so double-check it and use code with caution. Learn more'.

### Explanation:

- The loop is intended to count down from `n` to 0.
- However, incrementing `n` prevents the loop from reaching the terminating condition.
- AI identified that decrementing `n` allows the loop condition to eventually become false.
- This correction stops the infinite execution.

## Task 3: Handling Runtime Errors (Division by Zero)

### Scenario

A Python function crashes during execution due to a division by zero error.

### Requirements

- Provide a function that performs division without validation
- Use AI to identify the runtime error
- Let AI add try-except blocks for safe execution
- Review AI's error-handling approach

### Expected Output

- Function executes safely without crashing
- Division by zero handled using try-except
- Clear AI-generated explanation of runtime error handling

### Prompt:

“Identify the runtime error and modify the code to prevent program crash”

### Buggy Code

```
def divide(a, b):
    return a / b
print(divide(10, 0))
```

### AI-Detected Issue

The screenshot shows a code editor with Python code. The code defines a `divide` function that returns the division of `a` by `b`. A call to `divide(10, 0)` is made. A `ValueError` is raised because division by zero is not allowed. The AI has provided an explanation for the error and suggested a fix.

Please explain this error:

The `IndentationError: unexpected indent` happens because the `return a / b` line is not properly indented. In Python, indentation matters for code structure. It seems this line is indented too far within the `if` block.

Next steps: Explain error

What can I help you build?

Gemini 2.5 Flash

- Division by zero causes a ZeroDivisionError.

### Corrected code:

```
def divide(a, b):
    if b == 0:
        raise ValueError("Cannot divide by zero.")
    return a / b

print(divide(10, 2))
5.0
```

### Explanation:

- AI identified that the runtime crash occurs due to division by zero.
- It added a **validation check** before performing division.
- Raising a ValueError prevents unsafe execution and clearly informs the user.
- This approach ensures safer and more predictable program behavior.

## Task 4: Debugging Class Definition Errors

### Scenario

You are given a faulty Python class where the constructor is incorrectly defined.

### Requirements

- Provide a class definition with missing self-parameter
- Use AI to identify the issue in the `__init__()` method
- Allow AI to correct the class definition
- Understand why `self` is required

### Expected Output

- Corrected `__init__()` method
- Proper use of `self` in class definition
- AI explanation of object-oriented error

### Prompt:

“Identify the issue in the class constructor and correct it”

### Buggy Code

class Student:

```
def __init__(name, roll):
    name = name
    roll = roll
```

## AI-Detected Issue

```
class Rectangle:
    def __init__(self, length, width):
        self.length = length
        self.width = width

    def __init__(self, length, width):
        self.length = length
        self.width = width

File "/tmp/ipython-input-3084168182.py", line 4
    self.width = width
          ^
IndentationError: unexpected indent
```

Please explain this error:  
File "/tmp/ipython-input-3084168182.py", line 4 self.width = width  
The IndentationError: unexpected indent means there's an issue with how your code is indented. Specifically, the line contains an extra space or tab where none are expected.  
Accept & Run Accept Cancel

What can I help you build?  
Gemini 2.5 Flash

- Missing self parameter in the constructor.
- Instance variables are not properly assigned.

## Corrected Code:

```
class Rectangle:
    def __init__(self, length, width):
        self.length = length
        self.width = width
```

## Explanation:

- self is mandatory in instance methods to access object data.
- AI identified that length and width must be associated with the object.
- Adding self allows proper initialization of instance variables.

## Task 5: Resolving Index Errors in Lists

### Scenario

A program crashes when accessing an invalid index in a list.

### Requirements

- Provide code that accesses an out-of-range list index
- Use AI to identify the Index Error
- Let AI suggest safe access methods
- Apply bounds checking or exception handling

### Expected Output

- Index error resolved
- Safe list access logic implemented

### Prompt:

“Identify the index error and suggest a safe access method.”

### Buggy Code

```
numbers = [1, 2, 3]
print(numbers[5])
```

### AI-Detected Issue

```
numbers = [1, 2, 3]
print(numbers[5])

...
IndexError: list index out of range
```

Next steps: Explain error

- Index 5 does not exist in the list.
- Causes IndexError.

### Corrected code:

```
[1:2]
numbers = [1, 2, 3]
print(numbers[0])
```

Please explain this error:  
IndexError: list index out of range  
The IndexError: list index out of range means you're trying to access an element at an index that doesn't exist in the list. Your numbers list [1, 2, 3] only has elements at indices 0, 1, and 2. When you try to

What can I help you build?

Gemini 2.5 Flash

### Explanation:

- List indices must be within the range of list length.
- Checking bounds prevents runtime errors.
